

## Mosaic (DIPA) Specs

**ABV: 8.80%**

**IBU: 89.5**

**Original Gravity (OG): 1.082**

**Final Gravity (FG): 1.016**

**Color: Light Amber**

## **Mosaic (DIPA)**

### Ingredients

6.6 lbs Golden Light Liquid Malt Extract (late addition) \_\_\_\_\_

3.3 lbs Pilsen Liquid Malt Extract \_\_\_\_\_

1 lb Corn Sugar \_\_\_\_\_

Crushed Steeping Grains (in sealed plastic bag): \_\_\_\_\_

- 1lb Vienna Malt
- 1lb Caramel Red Malt
- .5lb Carapils
- .5lb Honey Malt

1 Muslin Bag \_\_\_\_\_

1 Dry Hop Bag \_\_\_\_\_

4.0 oz Mosaic Hops (1oz for dry hopping) \_\_\_\_\_

2.0 oz Magnum Hops \_\_\_\_\_

1 Package Safale 05 Yeast \_\_\_\_\_

Bottle Caps \_\_\_\_\_

Priming Sugar \_\_\_\_\_

### Directions

**\* Read all recommended procedures and material before you begin to brew.**

**\* All equipment must be cleaned and sanitized prior to brewing. It is especially important to clean and sanitize the equipment that comes in contact with your beer after it has been boiled. It must be properly sanitized or you risk affecting the taste and quality of your beer. Please call us if you have any questions or our uncertain about sanitizing. Please make sure your kit contains, malt extract, hops, corn sugar, and yeast before brewing.**

### **Brewing**

1. Fill your brew pot with 2.5 gallons of clean water. Heat water to 155 F.
2. Place the steeping grains inside a muslin bag and tie securely. Add the bag to the brew pot for 30 minutes. Maintain 155 F (Do Not Boil). After 30 minutes remove the bag and let drain in to brew kettle (Do not squeeze grain bag). Discard muslin bag with spent grains.
3. Turn off heat and add the 3.3 lbs of Pilsen liquid malt extract and the 1 lb bag of Corn Sugar. Stir the extract into the water to create your wort then turn heat back on and bring to a boil.
4. Add 2 oz of Magnum hops to the boiling wort. Do not let the wort boil over your pot. Boil for 30 minutes.
5. Add 1 oz of Mosaic hops to the boiling wort. Boil for 15 minutes.
6. Add the 6.6 lbs of Golden Light liquid malt extract and Add 1.0 oz of Mosaic hops to the boiling wort. Boil for 15 minutes.
7. Add 1 oz of Mosaic Hops and turn off heat. (This is sometimes called a Flameout or Knockout hop addition)
8. Cool your boiling pot filled with wort by placing it the your sink filled with cold water. Add ice to the water around the pot to accelerate the cooling process. Also stir the wort periodically with a sanitized spoon. When not stirring keep the lid on your brew pot. Replace the water around your pot with cold water when it becomes warm. Continue to cool the wort until it reaches 80°F. This should take at least 20 minutes. A copper wort chiller can also be used to cool your wort. Ask us about purchasing one if you would like.

9. Pour your wort into the sanitized fermenter. Top off the wort with cold water to the 5 gallon mark. Make sure it is 60-70°F before you sprinkle (pitch) the yeast on top of the wort. Stir with a sanitized spoon or paddle.
10. Place the sanitized lid on your fermenter making sure that it is locks securely. Now place your airlock, which has been sanitized and left half filled with sanitizing solution, into the lid.
11. Shake or rock your sealed fermenter for about 5 minutes for aeration.
12. Reopen your fermenter and remove about 8 oz. of wort with a sanitized cup or beer thief. Do not touch the wort in the fermenter with your hands. Take the wort sample and pour it into your test jar with the hydrometer in it until it floats. Record the specific (original) gravity and the potential alcohol readings. If wort is too foamy to record accurately, set aside until it settles.
13. Place the fermenter in a relatively warm place (60-70 deg F). This is the ideal temperature range for ales to ferment at. You should see evidence of fermentation (bubbling) within 12-36 hours. Not all fermentation behaves the same, and depends on factors such as temperature, yeast strain, and amount of fermentable sugar. Note: Cooler temperatures mean slower fermentation. Do not hesitate to call us or stop by if you have any questions.
14. 7 days after brewing transfer your beer to a secondary fermenter (carboy) if you have one then **add 1 oz of Mosaic hops in the sanitized hop sock to the fermenter for dry hopping.** Secondary fermentation is not necessary, but does improve the clarity and flavor of your beer. If you do not have a secondary fermenter then ignore the previous sentence and add the dry hops to your primary fermenter. After 7 days open your fermenter and remove a sample of your beer (8oz) with a sanitized cup or beer thief. Record your specific gravity and potential alcohol readings. Repeat this step every day until your readings stay the same for two days. This ensures that your fermentation is complete. If you are unsure error on the side of caution and wait a few days. Once you are sure that fermentation is complete you can determine the alcohol content of your beer by subtracting the first potential alcohol reading from your final reading ( $8.0\% - 1.5\% = 6.5\%$ ) Now its time to bottle.

## Bottling

1. Clean and sanitize all your bottles. You will need about 48 12oz. bottles or 27 22oz. bottles with non screw off caps. They can be purchased at O'Connor's or saved from your personal drinking stash.
2. Boil about 8oz. of water with your 5oz. of priming sugar for 10 minutes & stir until dissolved. Add this hot solution to your bottling bucket.
3. Siphon your beer from the fermenter to the bottling bucket. Try to leave as much sediment behind on the bottom of the fermenter. Gently stir to mix your sugar solution with your beer.
4. Place your bucket on a table. Remove the hose from the siphon unit, sanitize it then attach it to the spigot on your fermenter. Next attach the bottle bottle filler to the other end of the hose. Open the spigot and allow the beer to fill the hose. Fill each bottle by pressing the bottle filler to the bottom of each bottle. When the beer reaches the top of the bottle pull the bottle filler out of the bottle. When this is done it should leave the correct amount of head space in the bottle.
5. Sanitize your caps by soaking them in your sanitizing solution. To cap place a cap on each bottle and crimp with your capping device. Do not apply too much pressure; just let the capper do the work.
6. Natural carbonation occurs as a result of the suspended yeast in your beer consuming the priming sugar. Allow the beer to carbonate at room temperature (60-70 deg F) for about 10 days before refrigerating. Additional aging will improve the clarity and flavor of your beer. **ENJOY!**
