

Label the Plant

label the parts of the plant with the words in the box

Flowers and flowering plants play a very important role in nature. Not only are they beautiful, but their seeds, fruit, roots, stems and leaves provide food for people and animals.

DID YOU KNOW: broccoli is technically a flower! The green florets on the stalks are actually immature flowers, and if left to grow, open into tiny yellow flowers.

Flowers have been used in medicine for hundreds of years. They are used to make medicine that can stop you from coughing, cure a headache, make your stomach feel better, and even heal your skin when you get burned.

- roots
- stem
- leaves
- flower
- petal
